As part of the Centralized team responsible for RF/Traffic and Capacity Planning, I am actively involved in developing a capacity strategy for the submarkets to create their 3 year RAN capacity plan. In January I was actively involved in helping regions true up 2023POR and assign their 2024 POR. This followed closely the generation of 3 year plan study based on the 2024 submission numbers and their forecast for build plan year. I've also worked with them on the release of solutions within a week of being requested and help with project creation and updates when requested.

Im currently working on refreshing the nationwide RAN Plan to improve our company's pipeline by focusing regions in the most impactul solutions. With this effort we aim to ensure dollars are spent on the right solutions. Using Kime and Tableau I am providing an insight to the current pipeline to the leadership from different perspectives and proposing a RAN capacity strategy for the next 3 years.

I've done traffic training for the RF team in Sector Manager, Solution Manager and capacity basics during the May regional call with both UPNY and NYM to help the region better understand the sources of information on our tools. Additionally I do multiple 1:1 sessions with the RF engineers on various tool topics and Q&As. Since then I've started to work with them on a single page summary view for them to get the NPP information in order for them to easily identify issues like what persistent sectors has no solutions. After testing during the year we expect to open a feature for this view.

I've participated in Pulse surveys and completed all required training. I make myself available to multiple parties to answer questions and help with traffic, tableau and knime topics.

As part of the Traffic Team my direct customers are the engineers in my region which I support by meeting constantly during the year to drive the company initiatives. I support their efforts like providing network forecast view based on their solution selection. During the month of April I shared with them the Sub1 Trigger normalization dashboard that I developed with Gene Buist that identifies possible triggers that can improve by moving DSS carriers to 4G only in order to help them in the quest to lower the Sub1 trigger rate.

As part of the traffic team Ive helped drive the importance of BSS sectors in the system. During March I develop the feature to automate BSS label for solutions associated with BSS sectors to help users identify and prioritize those who can help reduce network churn.

To build the best network we have to have the best data. As a business owner of the Data Integrity team during the first part of the year I worked with our team members and our regions to improve the data quality in the system to improve our tool performance. I divide hosting responsibilities with my counterpart Kamil Gani for both our weekly team call and the biweekly call with the region POCs. We have focus in the first months of the year on the following areas with a positive outcome:

January 2024 – POR vs KITT Goals (after regions are done with the updates)

February 2024 – Audit pipeline projects which have activated call signs

March 2024 - NPP/RFDS Bandwidth Comparison Audit

April 2024 -NPP/RFDS initiative mismatches

May 2024 – Fuze Site Type

June 2024 - On-Air but not in Atoll

Goal

Traffic Engineering 2024

Description

- Best Systems
 - To drive field efficiency and accuracy, continue to identify and implement process improvements and workflow modifications.
 - Timely submit feature requests for upcoming PIs
 - Submit and escalate bug reports and tickets as needed
 - OPT and APT development - continue to engage with HQ and the developers on these tools and the algorithms that drive them (support ASEU forecasting model, KSS, KSP, etc)
 - Data Integrity – find errors, create audits, work with the submarkets to clean up our tools and golden sources, submit feature requests to fix issues
- Continue to improve VPI through Steerco discussions and launching new capabilities (Implement new methodology in February, add 5G & UL triggers)
- Incorporate Below Standard Service (BSS) into the process
 - Incorporate Customer Experience Metric Projections into VPI
- Evaluate Solution Effectiveness relative to OPT/Vision predictions
- Bring back Inefficient Sector visibility
 - Ensure working properly
 - Communicate and educate the markets on use of inefficient sectors - Potentially restarting the process of excluding inefficient triggers and not budget for solution.
- Support CE Quarterly Sync Meetings with material that will benefit the group
- Support incorporation of auto-seasonality flags
- Ensure alignment and clear communication with the finance team (especially when we make changes to Primary Rationale, which change the budget codes)
- Consistent monthly reporting/feedback to the regions on priorities.
 - Include SP/RF directors
 - Review of alignment of POR/BPY dates to KITT goals
 - Consistent reinforcement of status and BPY/POR definitions, and the need to keep all dates constantly maintained
 - Consistent update of trigger progress to target
 - Consistent update of BSS progress to target
 - Trigger 4G and 5G
 - What sector(s) need a solution?
 - What solutions need to be released?
 - Which solutions are released and need to be prioritized? Including educating and using KSP & KSS for prioritization with Planning and the markets
- Monitor changes to network traffic and report on it (requires executive, territory, and market-level reports as well as detail-level results for the submarkets to use and take action on;
 - C-Band
 - Offload
 - Total Data Volume by PEA or LTE or Submarket
 - % of total PEA data traffic - 4G, NW, C-Band, mmWave
 - Analysis of per-site information - C-Band as a % of total site traffic, trigger relief on congested sites, data volume increases tied to

- congestion relief (as best as we can see)
- UEs per sector or site, max UEs, unique UEs
- Throughput analysis
- mmWave
- Offload
- Analyze the need for 4G/5G combo sites
- 3-year Plan - support Vision (feedback loop) and support guiding submarket to work the right pipelines (pipeline size, pipeline effectiveness, etc)
- Assist with the development of the 2025 plan
- Ensure new sites are being deployed in the right areas and are solving the issue they were intended to solve (SGFI, Capacity, etc)
- Monthly Snapshot reviews

Comment Count 0**Manager****Comment****Employee****Comment**

As part of my traffic goals to drive the best network I do a monthly meeting where we discuss the highlights for the network and send a summary email to all the stakeholders: ED, Directors, RF Managers and the regional traffic engineers. During this meeting I always highlight the importance of being responsible with our resources and communicate our leadership initiatives.

I maintain the APT trigger dashboard monthly as it has been of great help for multiple regions. During the March update I added new metrics for region to compare the triggers based solely on the new method and the old one. I've also added new BSS metrics as well as the 5G triggers.

As part of the APT I've worked with interested parties to revamped the APT GUI in NPP. I've also tested and approved numerous features. During March I develop the feature to automate BSS label for solutions associated with BSS sectors.

During June I worked with Chris Schilling to deliver the SUB3 normalization dashboard in order to estimate the proposed offload for SUB3 triggers based on updating the network to 5G Standalone configuration. I've also been the driver for the new KSS formula into NPP. I'm currently working with the NPP development team to test values and fix bugs in the code. In the meantime I also published a national dashboard for KSS values so users can prioritize their solutions while waiting for the NPP implementation.
